Permanent Advisory Network for Diseases in Aquaculture

Why do we need the PANDA network?
- Despite the existence of the Reference Laboratory networks for fish and molluscan diseases, untapped expertise exists in a large number of institutes, universities, private companies, etc.
- A mechanism is required for drawing scientific information and advice from these resources so the European Commission can make better informed decisions on policies, regulations and research priorities for aquatic animal health.
- PANDA aims to establish a network of experts and provide them with a forum for debate and exchange of information, and to provide collated scientific advice to the European Commission.

How will the network operate?
- Five scientific work packages will address important topical aspects of disease in aquaculture.
- A project website provides a convenient forum for debate and dissemination of information.
- A permanent network will be established over the next 3 years, which will continue to be useful to its members and the European Commission after the completion of the project.

The scientific work packages

- **Risk analysis**
  Identification of the most significant exotic, emerging and re-emerging disease hazards.

- **Epidemiology**
  Production of a database of epidemiological characteristics of the major disease hazards for the EU, and development of surveillance and containment schemes.

- **Diagnostic methods**
  Assessment of the best diagnostic methods and recommendations for improvements, standardisation, validation and implementation.

- **Environmentally safe disease control**
  Recommendations for the best control techniques and policy/legislation options for the application of environmentally safe control methods.

- **Training needs and opportunities**
  Production of a database of training opportunities and identification of training requirements not currently met.

Who should get involved, and why?
- All practitioners in aquatic animal health are encouraged to join the PANDA network.
- Contribute to scientific publications and advice to the Commission, use the network to contact other experts in your field and exchange information, or simply keep abreast of the latest progress.
